IN THE ABSTRACT OF THE DISCLOSURE

Replace the abstract of the Disclosure currently of record with the attached new Abstract of the Disclosure.

In an information processor, a situation and operation storage section stores situation information, acquired by a situation acquiring section, about a situation in which an operation has been performed and operation information, received from an operation section, about the operation in an associated manner. A situation comparing section compares a current situation information piece with situation information pieces stored in the situation operation storage section. Based on situation information pieces stored in hierarchical structure in a situation hierarchy storage section, a broader concept common to two situation information pieces compared by the situation comparing section is searched for. If the broader concept of the current situation information piece agrees with that of a stored situation information piece, an operation adapting section adapts an operation procedure corresponding to stored operation information piece to the current situation, and a presentation selecting section executes the operation procedure.
